# Master Cross-Reaction List

## Immunoassay and Cross-Reactants

**Immunoassay-based screening methods provide high sensitivity but may be susceptible to specificity issues. Cross-reactivity of structurally similar substances may occur with immunoassay methodologies, potentially yielding false results.**

Immunoassay manufacturers test for common potential interfering substances and list those results in package inserts; however, testing every compound is not feasible. High doses of a single drug or concurrent dosing of multiple drugs may significantly influence urine immunoassay results. These clinical scenarios are difficult to replicate in a bench setting during the immunoassay development process and, as such, may only become known once the assay is introduced to the market.

The attached contains potential reactants and cross-reactants with most immunoassay methodologies. This list is not all inclusive. Other substances and/or technical or procedural factors may interfere with the test and cause false results. For the most current information relative to the immunoassay testing methodology utilized at your facility, refer to the package insert provided by the manufacturer of your kits or contact your manufacturer directly.

All positive results from onsite drug testing are presumptive and should be confirmed by a laboratory using an alternative methodology such as Liquid Chromatography / Mass Spectroscopy (LC/MS) or Gas Chromatography / Mass Spectrometry (GC/MS).
